Home Care Guidelines (COVID-19)

**NOTE:** These guidelines target suspected patients with mild symptoms or in home care quarantine. Suspected patients with chronic illnesses or fever should seek medical help immediately.

1. **Spatial Arrangements**
   - If possible, place the patient in a well-ventilated (windows kept open) single room. No visitors are allowed. The patient should wear a surgical mask as far as possible.

2. **Spatial Arrangements**
   - Other household members should stay in a different room. If a separate room is not available, do not share the same bed with the patient and keep a distance of at least 1 metre.

3. **Spatial Arrangements**
   - Limit the use of shared spaces (e.g., kitchen, bathroom) by the patient and ensure these spaces are well ventilated.

4. **Care Arrangements**
   - Designate a household member without chronic illness to be the main caregiver. When staying in the same room with the patient, wear a surgical mask to cover the nose and mouth completely. Avoid touching the mask during or after use. If the mask becomes wet or stained with secretions, replace it immediately. Dispose of the mask properly after use.

5. **Care Arrangements**
   - Wash hands frequently with water and soap for at least 20 seconds and dry hands with disposable paper towels, especially after coming into contact with the patient or his/her surroundings, before and after preparing meals, before meals, and after using the toilet.

6. **Care Arrangements**
   - Avoid direct contact with body fluids, including oral or respiratory secretions and stool. Use disposable gloves and a mask when providing oral or respiratory care and handling stool, urine, and other excreta. Wash hands before and after removing gloves and the mask, and dispose of the waste in a rubbish bin with cover.

7. **Care Arrangements**
   - Avoid dining together or sharing tableware, toothbrushes, towels, or bed linen with the patient.

8. **Cleaning Arrangements**
   - Use 1:99 diluted bleach solution to clean the household environment, bathrooms, toilets and the frequently touched surfaces daily.

9. **Cleaning Arrangements**
   - Use regular laundry soap (liquid) to wash the patient’s tableware, clothes, towels and bed linens. If conditions permit, machine wash at 60-90°C and dry thoroughly.

10. **Monitoring Arrangements**
    - As all household members are considered at-risk individuals, they should monitor their own body temperature and health status daily.

11. **Monitoring Arrangements**
    - If a household member develops fever or acute respiratory infection symptoms, including cough, sore throat, and difficulty in breathing, seek medical help immediately and inform medical staff of the details of their close contact. Wear a surgical mask and avoid public transportation en route to medical facilities.

Note: Developed based on health protection theories, WHO guidelines and China CDC COVID-19 home care advice after taking into account of Hong Kong’s local situations, this poster intends to empower community to practice health protection behaviours in home self-isolation. These guidelines may serve as useful resources for cities in comparable context, after being adapted for different local conditions such as lower population density allowing for longer social distance and shortage in supply hindering the using of face mask.
